It is isolated from human small intestine tissue cDNA library, identified using probes based on the consensus sequence DNA44825, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNFR) family of polypeptides. PRO364 sequence also shows
                           PRO364; DNA47365-1206; human; ATCC No: 209436; antiproliferative; neoplastic cell growth inhibitor; cytostatic; treatment; cancer; tumous breast; prostate; colon; lung; renal; ovarian; central nervous system; CNS; leukemia; melanoma; Expresed Sequence Tag; EST; TNFR homologue; tumour necrosis factor receptor; GTR protein homologue.

ö
homology to members of the TNFR family and mouse GITR protein. This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO565, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast,
                                                                                                                                                                                                                                                                                      180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŏ
showing identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The invention provides highly conserved TRII, TRIISVI and TRIISV2 proteins (see AAY9581), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISV1 and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency. X-IInked agammaglobulinemia, severe combined immunodeficiency (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency of the hyper Igw. TRIISV1 and/or TRIISV2 and/or TRIISV2 and/or Gardiciency with hyper Igw. TRII, TRIISV1 and/or TRIISV2 and/or diagnose an autoimmune disease, especially rheumatcid arthritis, systemic lupus erythematosus, thrombocytopenia purpura or Igh nephropathy. The polypeptides provides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the contraction of the contractio

The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenic disorder in mammals by modulating cell proliferation, and indigonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atheroscierosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB2438 to AAB2438 bro Present nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

cardiovascular, endothelial, angiogenic or angiostatic disorder. The PRO364 cDNA sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor receptor (TNFR) family of polypeptides. The tumour necrosis factor receptor (TNFR) family of polypeptides. The PRO175 cDNA sequence was 1solated from a library of cDNA fragments derived from human umbilical vain endothelial cells (HUVEC). Administering an effective amount of PRO364 or PRO175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGF_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Administering a therapeutically effective amount of an antibody that binds PRO364 or PRO175 is useful for inhibiting angiogenesis induced alsorder. PRO364 or PRO175 is useful for inhibiting angiogenesis induced disorder. PRO364 or PRO175, or their antagonists, are useful for vascular-related drug targeting or as therapeutic targets for the treatment or prevention of atherosclerosis, hypertension, inflammatory vascularides, Reynaud's disease, aneurysms, arterial restenosis, thrombophlebitis, tumor angiogenesis, gut protection or regeneration attraction of bone-forming cells, central and peripheral nervous system disease and neuropathies and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; PRO; antiinflammatory; dermatological; antiarthritic;

The present sequence is one of thirty three novel PRO polypeptides.

The PRO polypeptides, anti-PRO antibodies, agonists and antegonists are useful for treating and diagnosing immune related disorders such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sogren's systemic vaculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic demyelinating polyneuropathy or Guillain-Barre syndrome, and chronic inflammatory demyelinating polyneuropathy, hepatobiliary diseases (such as infectious, autoimmune chronic active hepatitis, primary clirhosis, granulomatous hepatitis and sclerosing cholangitis), inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's diseases, autoimmune or immune-mediated skin diseases (such as such as asthma, allergic chimitis, atopic dermatitis, food hypersensitivity and urricaria), immunological diseases of the lung (such as eosinophilic pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumoniis), transplantation associated diseases including graft rejection and graft-versus-host diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                 , Gurney AL;

The present sequence is that of novel human immunomodulator PR0364 (16 kDa) isolated from a sequence from cDNA (see AAF30057) isolated from a small intestine library. PR0364 (26 kDa) p16.34) shows sequence homology to mouse GITR protein and may be its human counterpart. The invention provides polynuclectides (see AAF30050.62) encoding novel human PR0 proteins (see AAB20108-20) including PR0364.

Claimed compositions comprising the proliferation of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune response, or increasing the proliferation of T-lymphocytes in a response to an antigen. Claimed compositions comprising a PR0 polypeptide or its antagonist have the opposite effect. A claimed method for treating an immune related disorder, such as a TCC claimed method for treating an immune related disorder, such as a TCC claimed method for treating an immune related disorder, such as a relibody or an antagonist antibody. The disorder is selected from systemic inpus erythematosus, rheumatorid arthritis, osteoarthritis, of call disorder inflammatory myopathy, Sjogren's syndrome, systemic sclerosis, idiopathic inflammatory myopathy, Sjogren's syndrome, systemic sclerosis, idiopathic inflammatory myopathy, Sjogren's syndrome, systemic sclerosis, cautoimmune chronic active hepatitis, primary bilitus, immune-mediated renal disease, demyelinated disease, (such as multiple sclerosis), autoimmatous hepatitis, sclerosing cholangitis, inflammatory bowel disease (ulcerative collitis and Crohn's disease), gluten-sensitive enteropathy, Whipple's disease, cautoimmune mediated skin diseases (such as bullous skin disease, captoin multiperme and psoriasis), allergic diseases (the lung and transplantation associated diseases (such as suchman allergic thinitis, and graditismed methods of diseases) (autoimmune mediated securing the level of expression of the PRO gene. Also colaimed are a method as graft rejection and graft-versus'host diseases on method of diseases is not a method of diseases of the methods 
                                                                                                                                                                                                                                                                                                                                                                       Godowski PJ, Gurney AL;
Tumas D, Watanabe CK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New PRO polypeptides, nucleic acids and (ant)agonists, useful for diagnosing and treating immune-related disorders, such as multiple sclerosis, rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host cells, antibodies, and a method of stimulating the proliferation of T lymphocytes

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, protein, agonists or antagonists of a PRO protein, agonists or antagonists of a PRO protein, agonists or antagonists of a PRO protein, adonists of a PRO protein, adonists of a PRO protein, agonists or antagonists of a PRO protein, adonists of a PRO protein, adonists of a PRO protein, adonisting a compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid; and methods of inhibiting or stimulating endothelial call growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof.

PRO nucleic acids, PRO protein, or an agonist or antagonist thereof.

PRO nucleic acids, PRO protein, and becades therapeutic agents to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cardiovascular, endothelial or angiogenic disorders, such as atherosclerosis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate colNAs with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential therapeutic agents. The present sequence represents a PRO protein of the
                                                                                                                                                                                Goddard A;

nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma. cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, angina, myocardial antagonists are also used to prevent tumour angiogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and tissue regeneration. The PRO nucleic acids, polypeptides and anti-PRO antibodies are useful for diagnosing a cardiovascular, endothelial or angiogenic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cancer;

mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO agonist or antagonist: a retroviral gene therapy vector comprising a PRO andleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof.

PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as a therosclerosis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, come therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the devalopment and screents a PRO protein of the therapy. PRO nucleic agence represents a PRO protein of the

This is the amino acid sequence of the truncated human 312C2 T cell protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoletic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTFSGGHEG 126

The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial infarctions, Reynaud's disease, rheumatoid arthritis, angina, myocardial antagonists are also used to prevent tumour anglogenests and for treating periodontal diseases. The PRO nucleic acids, polypeptides and prisue regeneration. The PRO nucleic acids, polypeptides and antibodies are useful for diagnosing a cardiovascular, endothelial or

The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO protein, agonists or antagonists of a PRO protein, and compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO expression or activity, diagnossing a cardiovascular, endothelial or anglogenic disorder, or a susceptibility to such a disorder by detecting

corticoid-induced tumor necrosis factor receptor (hGTTR).

Corresponding ligand (hGTTR), PR0175, is given in AAB47056.

Rosissa and PR0175 may be used in a mixture with a cardiovascular, endothelial, anglogenic or anglostatic agent for the treatment of a cardiovascular, endothelial, anglostatic agent for the treatment of a cardiovascular, endothelial, anglostatic agent for the treatment of a cardiovascular, endothelial, anglostatic or anglostatic disorder. The PR0364 cDNA sequence was isolated from an expressed sequence tag (EST) at ababase as having homology to members of the tumour necrosis factor receptor (TNFR) family of polypeptides. The PR0175 cDNA sequence was isolated from an library of cDNA fragments derived from human umbilical vein endothelial cells (HUVEC). Administering an effective amount of PR0364 or PR0175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGE_Zalpha), characterized by the presence of an elevated level of page_Zalpha), characterized by the presence of an elevated level of page_Zalpha), charactering a therapeutically effective amount of an antibody that binds PR0364 or PR0175 in a human suffering from a tumor or a retinal disorder. PR0364 or PR0175, or their antagonists, are useful for vascular-related drug targeting or as therapeutic trargets for the presence of an antibody is the presence of an subman suffering the page.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition for diagnosing and treating cardiovascular, endothelial and angiogenic disorders, comprises a PRO364 or PRO175 polypeptide -

The present sequence is one of thirty three novel PRO polypeptides.

The PRO polypeptides, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders such as systemic lupus erythematosus, rheumatoid arthritis, costeoarthritis, juvenile chronic arthritis, spondyloarthropathies, Slogrem's systemic vasculitis, sarcoidosis, autoimmune heemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic demyelinating polyneuropathy or Guillain-Barre syndrome, and chronic inflammatory demyelinating polyneuropathy), hepatobiliary diseases (such as infectious, autoimmune chronic active hepatitis, primary inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases (such as bullous skin diseases, autoimmune or immune-mediated skin diseases, such as asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity and urticaria), immunological diseases of the lung (such as ecsinophilic pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonias, idiopathic pulmonary fibrosis including graft rejection and graft-versus-host diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; PRO; cardiant; antianglogenic; antiarteriosclerotic; hypotensive; vasotropic; antirheumatic; antiarthritic; antiarthriticametory; cytostatic; vulnerary; antianginal; gene therapy; cardiovascular disease; endothelial disorder; anglogenic disorder; cancer; periodontal disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TSAQLGLHIWQL-----RKTQLLLEVPPSTEDARSCQFPEEERGERSAEEKGRLGDLW 233

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing; a cardiovascular, endothelial or anglogenic disorder in mammals by modulating cell proliferation, anglogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with imappropriate PRO expression such as cardiovascular, endothelial or anglogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiar hypertrophy). For example, the nucleic acids (NCs) and vectors cardiar hypertrophy). For example, the nucleic acids (NCs) and vectors associated with decreased PRO expression. AAA77510 to AAA77721 and AAB4138 to AAB4135 represent nucleotide and protein sequences used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Goddard A;

                                                                                                                                                                                                                                                                                                               clone, designated as DNA47365-1206. It is isolated from human small intestine tissue cDNA library, identified using probes based on the consensus sequence DNA4825, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRR) family of polypettides. PR0364 sequence also shows homology to members of the TNRR family and mouse GITR protein.

This clone is assigned the ATCC deposit No: 209436. PR0364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PR0655, PR0364 and PR0344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                  The present sequence is the human PRO364 protein, encoded by the cDNA
                                                                                                                                                                                      for

Claimed compositions comprising a PRO polypeptide or its antagonist have the opposite effect. A claimed method for treating an immune related disorder, such as a T cell disorder, involves administering a PRO polypeptide, an agonist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathy, systemic sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New PRO polypeptides, nucleic acids and (ant)agonists, useful for diagnosing and treating immune-related disorders, such as multiple sclerosis, rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of novel human immunomodulator PRO364 (UNQ319), as deduced from CDNA (see AAF30057) isolated from a small intestine library. PRO364 (26 kDa, pt 6.34) shows sequence homology to mouse GITR protein and may be its human counterpart. The invention provides polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAB20108-20) including PRO364. Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              response, or increasing the proliferation of \bar{r}-lymphocytes in a mammal in response to an antigen.                                                                                                        Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                       The present invention relates to methods for stimulating or inhibiting anglogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO238, PRO364, PRO844, PRO846, PRO845, PRO815, PRO311, PRO333, PRO840, PRO877, PRO877, PRO879, PRO882, PRO885 or PRO387. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or angiogenic disorders. The present sequence is one of the proteins of the invention.

receptor-like protein TRII (see also ARY95879), a novel protein showing identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The invention provides chighly conserved TRII, TRIISVI and TRIISV2 proteins (see ARY95879-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, X-linked agammaglobulinemia, severe combined immunodeficiency, Kscht-Aldrich syndrome or X-linked immunodeficiency (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency with hyper IgM. TRII, TRIISVI and/or TRIISV2 antagonists (e.g. antibodies) are used to treat, prevent, prognose andyor diagnose an autoimmune disease, especially rheumatoid arthritis, systemic lugus erythematosus, thrombocytopenia purpura or IgA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in polypeptides may also be used Methods for screening for

The invention relates to TRII and teceptor-like protein (TRII receptor). The invention relates to TRII and two variants RTISVI and TRISV2. The nucleotide sequences were determined by sequencing cloned CONAS AS37765.237766. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR).

TRII, TRIISVI and TRISVI polypeptides may be involved in the requiation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for agonists/Antagonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, blood pistolet disorders by wounds resulting immune deficiency disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat hear attacks, strokes, Addison's disease, heamolytic anamemia, rheumatoid arthritis, Goodpastures syndrome, Grave's disease, multiple sclerosis, mysathenia gravis Stiff-Man syndrome, disease, multiple sclerosis, mysathenia gravis Stiff-Man syndrome, systemic lupus erythematosus, Guillain-Barre syndrome, insulin dependent chance, or autoimnume inflammatory peripheral necepticion or graft versus host disease, inflammatory conditions, ischaemia-reperfusion or graft versus host disease, inflammatory conditions, ischaemia-reperfusion chances and central nervous system disease, emperpriblicative disorders, or infections and central nervous system disease, emperpending and central nervous system disease, and central nervous system disease, emperenced for repair and entral nervous systemic sequenced for challers and central nervous systemic sequenced for challers and entral nervous systemic sequenced for challers and entral nervous systemic sequenced for challers and entra

protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoletic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                            Human 312C2 T cell protein; thymus cell; spleen cell; T cell;

                                                                                                                                                                                                                                                                                            οy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents human PRO364, a novel member of the tumour necrosis factor receptor family. The sequence was deduced trom a bone matrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO, Escherichia coll or yeast host cells, are provided. Claimed c polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respdies 157-167 of PRO364. PRO364 polypeptides C are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells (claimed). Chimeric molecules comprising a PRO364 polypeptide (ised to a heterologous sequence such as epitope tag or immunoglobulin Fc region are also claimed. PRO364 polypeptide c assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or
       Tumour necrosis factor receptor homologue - useful for, e.g. modulating apoptosis and NF-KB activation and proinflammatory or autoimmune responses

The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as inhibitors.

The present sequence is that of human tumour necrosis factor receptor-like protein TRII, a novel 25 kDa protein which shows for receptor family related gene. The sequence was deduced from a cDNA clone (see AAA50304) discovered in a T-helper cell library. TRII activated NF kappas Hrough a TRAE-mediated mechanism.

Expression is activation-inducible. The TRII ligand is constitutively expressed in an endothelial cell line. This suggests that TRII and its invention provides TRII, TRIISVI and TRIISVI and TRIISVI and See AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/Or TRIISVI polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an

                         (SCID), Wiskott-Aldrich syndrome or X-linked immunoglobulin deficiency with hyper IgM. TR11, TR11SV1 and/or TR11SV2 antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                   arthritis, systemic lupus erythematosus, thrombocytopenia purpura or 1gA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.

                                                     protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or applicals. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                         Gaps

receptor-like protein TRII, a note; 125 kDa protein which shows
58.6% identity to murine glucocorticoid induced tumour necrosis
cator receptor family-related gene. The sequence was deduced from
a count clone (see AAA50304) discovered in a Thelper cell library.
TRII activated NF-kappaB through a TRAF2-mediated mechanism.
TRII activated NF-kappaB through a TRAF2-mediated mechanism.
Expression is activation-inducible. The TRII ligand is constitutively expressed in an endothelial cell line. This suggests that TRII and
its ligand may be involved in activated T-cell trafficking.
The invention provides TRII, TRIISVI and TRIISV2 nucleic acids
(see AAA50304-06) and highly conserved encoded proteins (see
AAA50304-06) and highly conserved encoded proteins (see
AAY5079-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful
for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency
x-linked agammaglobulinemia, severe combined immunodeficiency
(SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency
antagonists (e.g. antibodies) are used to treat, prevent, prognose
and/or diagnose an autolimmune disease, especially rheumatoid
arthritis, systemic lupus erythematosus, thrombocytopenia purpura
or IgA nephropathy. The polypeptides and/or antibodies can be administered to cells in vitro, ex vivo or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present sequence is that of human tumour necrosis factor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA library. This sequence is expressed in cardiovascular and haematopoidetic/immune tissues. MACP shows antiarteriosclerotic, antiating hepatotropic, antiafilammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antithyroid, thyromimetic, immunosuppressive, osteopathic, antiatritic, uropathic, antiulicer, and ophthalmological activities. The present sequence is useful in the adiagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arterlosclerosis, atherosclerosis, bursatis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of the human tumour necrosis factor receptor-like protein (TRII receptor). The invention relates to TRII and two splice variants TRIISVI and TRIISV2. The nucleotide sequences were determined by sequencing cloned cDNAs AAZ37765-237766. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR). TRII. TRIISVI and TRIISV2 polypeptides may be involved in the regulation

                                                                                                                                                                                                                                                                                                                                                                                                              This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.

The sequence was deduced from a bone marrow cDNA clone (see AX88670). Methods for the recombinant production of PR0364 polypeptides, e.g. in CHO, Bscherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid resoldes 15-167 of PR0364. PR0364 polypeptides are useful for modulating apoptosis, NF-KB activation and profine in mammalian cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Calaimed). Chimeric molecules comprising a PRO364 polypeptide fused to a heterologous sequence such as epitope tag or immunoglobulin For region are also claimed. PRO364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as

                                                                                                                                                                                                                                               The present sequence is that of human tumour necrosis factor receptor-like protein TR118V2, a novel 26 kDa protein which shows 18.68 identify to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The sequence was deduced from a cDNA clone (see AAA50306) discovered in an activated T-cell library. The invention provides TR11, TR118V1 and TR118V2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50809-81), as well as vectors, host cells and recombinant methods for their production. TR11, TR118V1 and/or TR118V2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency action of the transportance of the creat, prevent, prognose an autoimmune disease, especially prevent, prognose can autoimmune disease, especially remains and the contract of the creat, prevent, prognose can autoimmune disease, especially remains and the contract of the creat of the creat of the contract 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumour necrosis factor receptor-like protein; TR11; TR11SV1; TR11SV2; GITR; growth; differentiation; cell death; immune deficiency disorder; Digeorges syndrome; HIV; SCID; Wiskott-Aldrich disorder; anaemia; Stiff-Man syndrome; arthritis; multiple sclerosis; diabetes; Algheimer's disease; Parkinson's disease; Huntingdon's disease;
                                                     Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       arthritis, systemic lupus erythematosus, thrombocytopenia purpura or iga nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

This is the amino acid sequence of the human tumour necrosis factor receptor-like protein splice variant 2 (TRIISV2 receptor). The invention claims to TRII and two splice variants TRIISV1 and TRIISV2. The invention uncleotide sequences were determined by sequencing cloned cDNAs nucleotide sequences were determined by sequencing cloned cDNAs AA237765-Z37766. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family related gene (GITR). TRII, TRIISV1 and TRIISV2 polypeptides may be involved in the regulation of cell type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, blood platelet disorders or wounds resulting from trauma or immunodeficiency (SCID), Wiskott-Aldrich disorder, blood coagulation disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, haemolytic anaemia, rheumatosia gravis, surgery can also mania, inheumatosia gravis, syndrome, grave's disease, multiple sclerosis, mysthemia gravis, stiff-Man syndrome, systemic alpuse erythematosus, Guillain Barre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager syndrome). The products can also be used for detection, diagnosis and prognosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                syndrome, insulin dependent diabetes mellitus or autoimmune inflammatory eye disease, anaphylaxis, hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections. They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                            The present inference of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic selected from systemic inflammatory myopathies, sjopen's systemic solections, diopathic inflammatory myopathies, sjopen's systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, and peripheral nervous systems, hepatobiliary diseases of the central and peripheral nervous systems, hepatobiliary diseases of the central cand peripheral nervous systems, hepatobiliary diseases, disease, cutoimmune or immune-mediated skin diseases, allergic diseases, immune-mediated skin diseases, allergic diseases, cancoimmune or immune-mediated skin diseases, allergic diseases.

Cantoimmune or immune-mediated skin diseases, allergic diseases.

Immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

Cantoimmune or shuman PRO sequences AAC58679 to AAC58642 and AAC58678 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                               Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes sixty four human PRO proteins which can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to methods for stimulating or inhibiting anglogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO238, PRO346, PRO846, PRO846, PRO205, PRO205, PRO321, PRO333, PRO8410, PRO846, PRO845, PRO885 or PRO367. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or anglogenic disorders. The present sequence is one of the proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PRO364; DNA47365-1206; human; ATCC No: 209436; antiproliferative; neoplastic cell growth inhibitor; cytostatic; treatment; cancer; tumour; breast; prostate; colon; lung; renal; ovarian; central nervous system; CNS; leukemia; melanoma; Expressed Sequence Tag; EST; TNFR homologue; tumour necrosis factor receptor; GITR protein homologue.
                                                                                                                                                                                                                                useful for preventing, disgnature and treating disgnosing a cardiovascular, endothelial or angiogenic disorder in mammals by andulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and disgnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosolerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors conclaining them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24455 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                   Gerber H, Hillan KJ, Goddard A;

clone, designated as DNA4735-1206. It is isolated from human small intestine tissue cDNA library, identified using probes based on the consensus sequence DNA4815, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to the Incyte expressed sequence receptor (TNFR) family of polypeptides. PRO364 sequence also shows homology to members of the TNFR family and mouse GITR protein.

This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO655, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of natural nectors raceptor-like protein TRISY1, a novel 26 to protein which shows 58.6% identity to murine glucocorticoid induced tumour necrosis factor receptor family related gene. The sequence was deduced from cDNA (see AAA50305) discovered in a PHA-stimulated T-cell library. The invention provides TRI1, TRIISV1 and TRIISV2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) as well as vectors, host cells and recombinant methods for their production. TRII, TRIISV1 and/or TRIISV2 polypeptides are useful immunodeficiency, reating, preventing, prognosis and/or diagnosis of an immunodeficiency (SCID) Wiskott-Aldrich syndrome or X-linked immunodeficiency (SCID) Wiskott-Aldrich syndrome or X-linked immunodeficiency anthonian and antigonists (e.g. anthodies) are used to treat, prevent, prognose an autoimmune disease, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
                                                                                                                                                                                                               arthritis, systemic lupus erythematosus, thrombotytopenia purpura or IgA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for

The present sequence is that of human tumour necrosis factor receptor-like protein TRI1 (see also AAY95879), a novel protein showing identity to murine glucocorticoid induced tumour necrosis factor receptor family related gene. The invention provides factor receptor family related gene. The invention provides highly conserved TRI1, TRI1SV1 and TRI1SV2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TRI1, TRI1SV1 and/or TRI1SV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency. Trinked agammaglobulinemia, severe combined immunodeficiency (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency and/or TRI1SV2 and/or diagnose an autoimmune disease, especially rheumatoid anthritis, systemic lugus erythematosus, thrombocytopenia purpura arthritis, systemic lugus erythematosus, thrombocytopenia purpura cantibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the
